Practice: CSS System Starter

Layer Order: The CSS uses six layers: reset, base, layout, components, utilities, and overrides. This structure helps keep all styles organized and easier to maintain.

Three Token Decisions:

Color: I used custom properties for primary, secondary, and background colors to keep the design consistent.

Spacing: I created small, medium and large spacing variables to maintain the spacing across the page.

Shape: I used border-radius variables to keep the buttons, cards, and other components consistent.

CSS Maintainability: Using CSS variables and reusable classes made my stylesheet easier to maintain. For example, I can now change my primary color in one place instead of updating it throughout the stylesheet.

AI Disclosure: I used AI to help me review and guide me through my assignment. It also helped me check that my code aligned with the assignment requirements.
